Online Hotel Room Booking System

Aim

To design and develop a responsive hotel room booking website that allows users to register, check room availability, book, modify and cancel rooms, and allows the administrator to manage room quantity, price, bookings and static pages.

Algorithm

1. Start the application; the user registers, logs in, and can view or modify the profile.
2. User enters destination, dates and number of guests, and checks room availability for the chosen room type.
3. If rooms are available, the user fills in the booking form and pays through the payment gateway; otherwise other dates are suggested.
4. Save the booking, reduce the room count and send a confirmation email to the user.
5. User views booking history and can change or cancel a booking only if the arrival date is at least 3 days away.
6. User posts a review and rating after the stay.
7. Administrator logs in, changes the quantity and price of the room types, and modifies or cancels any booking.
8. Administrator edits static pages (room information, about us, contact us, Q&A, travel guide, privacy policy) and logs out.
